

### Mountain/Trail Bike

#### **Problem**

Current coil spring and urethane bumper suspension methods provide marginal damping from impact and vibration. These systems also are susceptible to wear and rebound control problems.

#### **Solution**

Airmount isolators positioned at the rear and/or mid-section of the bike frame to cushion, absorb and isolate impact and vibration.

#### **Benefit**

The isolators provide constant isolation efficiency, virtually eliminate rebound and require no maintenance or lubrication. Another key advantage: isolators can be adjusted for different sizes/weights of riders.
